

# Automating SCOM Tasks Using SMA

Microsoft MVP Community Camp 2015 Melbourne

Tao Yang

MVP: System Center Cloud and Datacenter Management

[tyang@tyang.org](mailto:tyang@tyang.org)

# About Myself

- System Center Cloud and Datacenter Management (SCCDM) MVP
- Heavily focused on System Center Operations Manager (SCOM)
- Also working in SCCM, Orchestrator, SMA, VMM, SCSM, Hyper-V etc.
- Management Pack Author
  - OpsMgr Self Maintenance Management Pack
  - ConfigMgr 2012 (R2) Client Management Pack
  - SCOM Maintenance Mode Scheduler Management Pack
- Communities
  - Blog: <http://blog.tyang.org>
  - Cross Blog: <http://www.systemcentercentral.com>
  - Twitter: @MrTaoYang

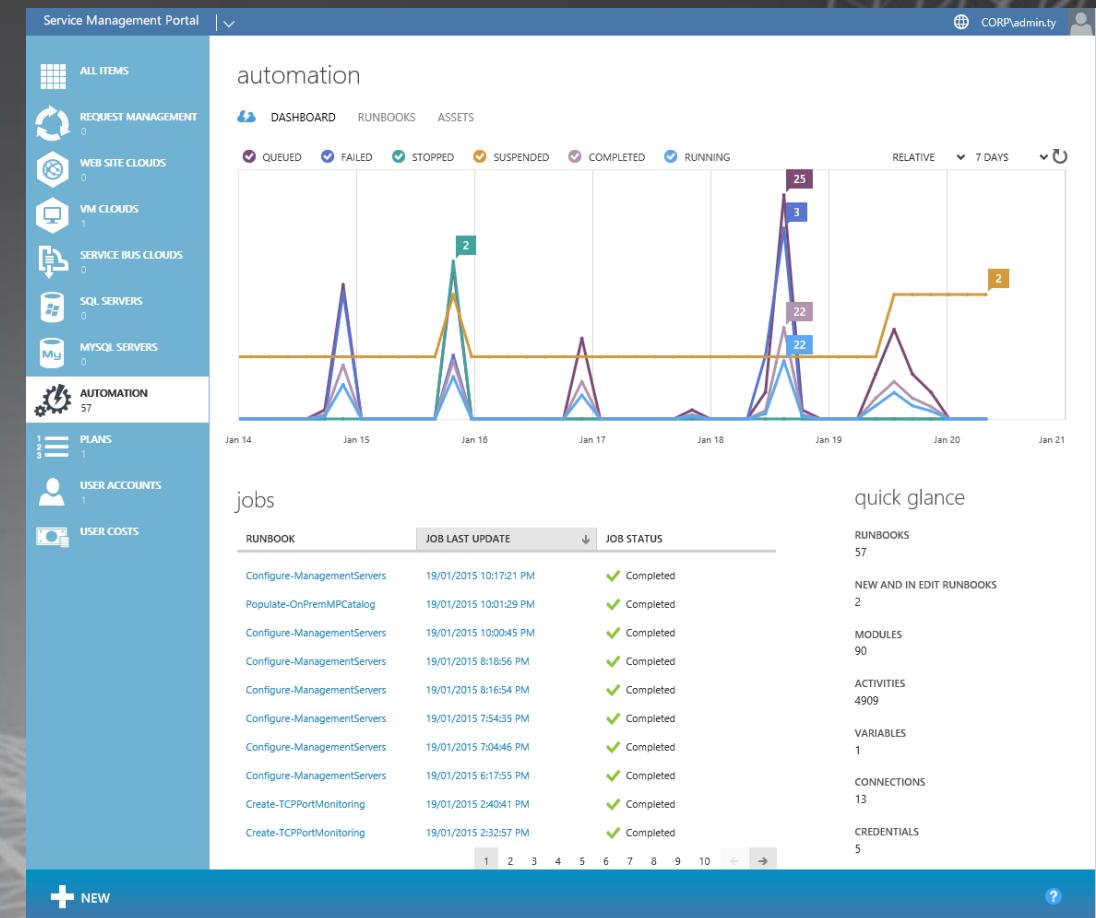

# Agenda

- Short SMA Introduction
- Challenges in SCOM Automation
- SCOM Automation Using SDK
- Lots of Demos
  - Copy Management Group Settings
  - Create New Management Pack
  - Create Performance Monitor
  - Populate a MP List on SharePoint
  - Copy MP (Between Management Groups)
  - Create TCP Port Monitoring
- Q & A

# What is Service Management Automation (SMA)

- New Member of the System Center 2012 R2 family
- Automation engine based on PowerShell Workflow
- Integrated with WAP Admin Portal (Under Automation Tab)
- 64-bit PowerShell
- Using Existing PowerShell Modules

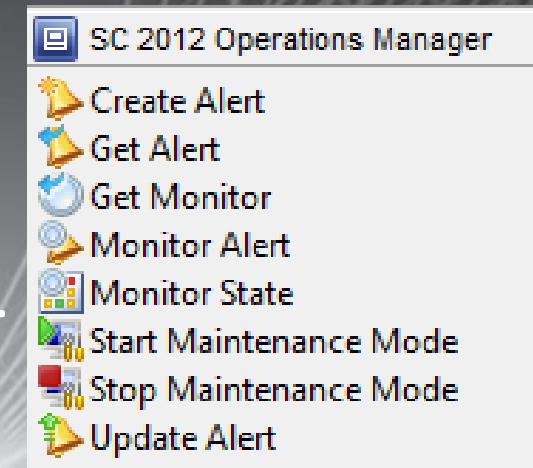

# SMA & Orchestrator – Better Together?

- Good Analogy from SCCDM MVPs Michael Rüefli and Markus Klein in their 2014 SCU Europe Presentation

# SCOM Automation - Challenges with Orchestrator

- Can't really do much with only 8 activities!
- Must install SCOM Operations Console of the same version on the runbook designer computer and the runbook server
- What if I'm running both SCOM 2007 and 2012?
  - Cannot mix SCOM components from different versions
  - Must use a separate runbook server for SCOM 2007 runbooks.

# SCOM Automation - Challenges in SMA

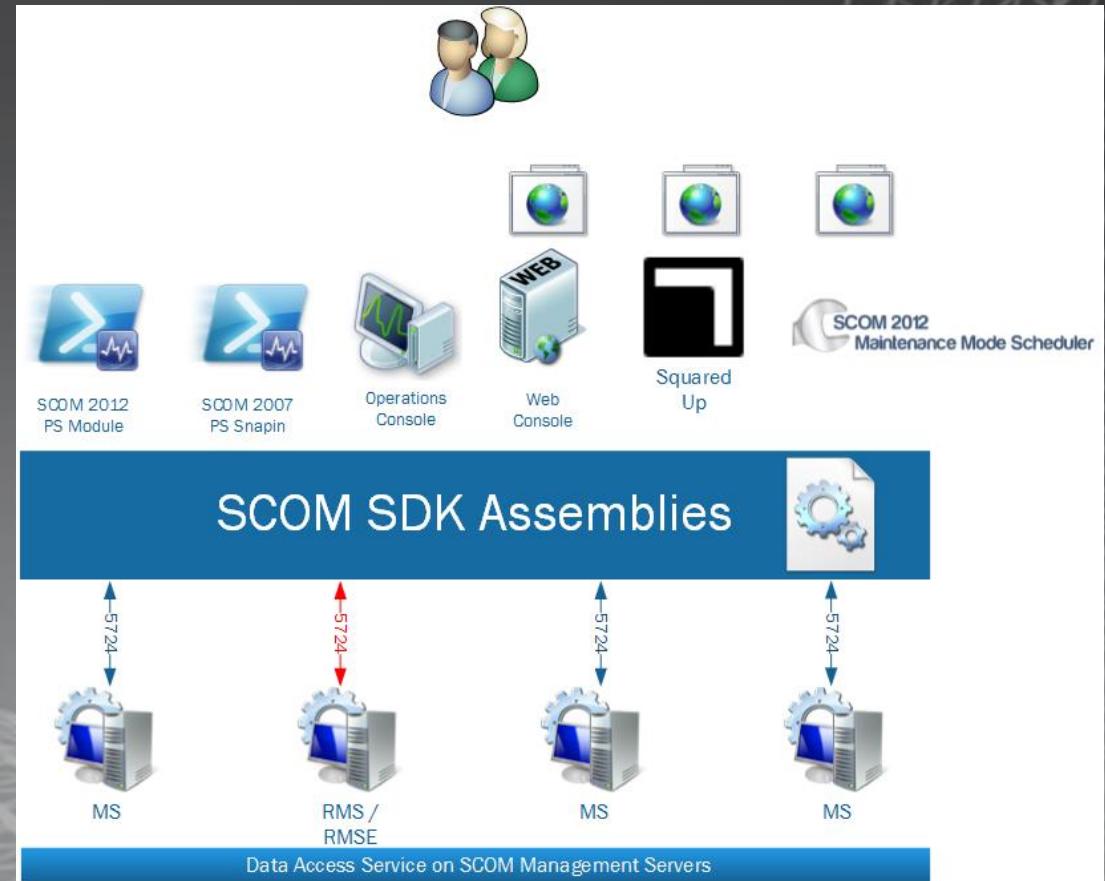

- OperationsManager module is a Portable Module
  - Proxying commands to the original OperationsManager module
  - Requires the original OperationsManager module to be installed on all Runbook Workers

```
try { $params = $PSBoundParameters; OperationsManager\Export-SCOMManagementPack @params } catch {  
$message = '' + $env:COMPUTERNAME + ' does not have the OperationsManager module installed.  
Either this cmdlet must be called from an inline script against a machine with the  
OperationsManager module installed, or you must install the OperationsManager module on ' + $env:  
COMPUTERNAME; if($_.FullyQualifiedErrorId -eq "CouldNotAutoLoadModule") { throw $message } else {  
throw $_ } }
```

- SMA today is lacking monitoring activities
  - i.e. monitor alerts,
  - monitor SharePoint list items, etc.

# Scripting in SCOM (Overview)

- All SCOM user interfaces use SDK to communicate with management servers
- SCOM 2012 SDK:
  - Microsoft.EnterpriseManagement.Core.dll
  - Microsoft.EnterpriseManagement.OperationsManager.dll
  - Microsoft.EnterpriseManagement.Runtime.dll
- SDK DLLs are installed into the Global Assembly Cache (GAG) with:
  - Management Server
  - Operations Console
  - Web Console
- SDK DLLs are also located on Mgmt Servers:
  - “<SCOM Install Dir>\Server\SDK Binaries” folder
- What can I do with the SDK assemblies?
  - **EVERYTHING!!**

# Scripting in SCOM (Loading SDK)

- PowerShell can leverage the SCOM SDK **DIRECTLY!**
- Loading SDK Assemblies from Global Assembly Cache (GAC):

```
#Load SCOM SDK DLLs from GAC
[System.Reflection.Assembly]::Load("Microsoft.EnterpriseManagement.Core, Version=7.0.5000.0, Culture=neutral, PublicKeyToken=31bf3856ad3")
[System.Reflection.Assembly]::Load("Microsoft.EnterpriseManagement.OperationsManager, Version=7.0.5000.0, Culture=neutral, PublicKeyToken=31bf3856ad3")
[System.Reflection.Assembly]::Load("Microsoft.EnterpriseManagement.Runtime, Version=7.0.5000.0, Culture=neutral, PublicKeyToken=31bf3856ad3")
```

- Loading SDK DLLs from a folder:

```
#Load SCOM SDK DLLs from a folder
[System.Reflection.Assembly]::LoadFrom("C:\Temp\Microsoft.EnterpriseManagement.Core.dll")
[System.Reflection.Assembly]::LoadFrom("C:\Temp\Microsoft.EnterpriseManagement.OperationsManager.dll")
[System.Reflection.Assembly]::LoadFrom("C:\Temp\Microsoft.EnterpriseManagement.Runtime.dll")
```

# Scripting in SCOM (Connecting to MG)

- Define MG Connection Setting

```
#Define Connection Setting
$ConnectionSetting = New-Object Microsoft.EnterpriseManagement.ManagementGroupConnectionSettings("OpsMgrMS01")

#Optionally, specify username and password
$UserName = "Domain\SCOMAdmin"
$Password = ConvertTo-SecureString -AsPlainText "password1234" -force
$ConnectionSetting.UserName = $UserName
$ConnectionSetting.Password = $Password
```

- Connect to MG and Get MG Admin object

```
#Connect to SCOM Management Group
$MG = New-Object Microsoft.EnterpriseManagement.ManagementGroup($ConnectionSetting)

#Get Management Group Administration
$Admin = $MG.Administration
```

# Scripting in SCOM (SDK Tips)

- Use the ManagementGroup instance (\$MG) to:
  - Retrieve Management Group information
  - Get and create Management Pack elements (classes, rules, monitors, discoveries, tasks, module types, monitor types), and much more.
- Use the AdministrationManagement object (\$Admin) to perform administrative tasks such as:
  - Configure Management Group settings
  - Add or delete agents / management servers, etc.
- SCOM SDK Fully documented on MSDN:
  - <http://msdn.microsoft.com/en-us/library/hh329086.aspx>
- Many good examples from OpsMgr Self Maintenance MP
  - <http://blog.tyang.org/2014/06/30/opsmgr-2012-self-maintenance-management-pack-2-4-0-0/>

# SMA / PowerShell Module: OpsMgrExtended

- Place DLLs in the PS Module folder
- No need to install any SCOM components
- Can be used as:
  - SMA Integration Module
  - Normal PowerShell module
- Cannot use native SCOM module cmdlets

```
Function Import-OpsMgrSDK
{
    <#...#>
    #OpsMgr_2012_R2_SDK_DLLs
    $DLLPath = (Get-Module OpsMgrExtended).ModuleBase

    $arrDLLs += 'Microsoft.EnterpriseManagement.Core.dll'
    $arrDLLs += 'Microsoft.EnterpriseManagement.OperationsManager.dll'
    $arrDLLs += 'Microsoft.EnterpriseManagement.Runtime.dll'
    $DLLVersion = '7.0.5000.0'
    $PublicKeyToken='31bf3856ad364e35'

    #Load SDKs
    $bSDKLoaded = $true
    Foreach ($DLL in $arrDLLs)
    {
        $AssemblyName = $DLL.TrimEnd('.dll')
        #try load from GAC first
        Try {
            Write-Verbose "Trying to load $AssemblyName from GAC..."
            [Void][System.Reflection.Assembly]::Load("$AssemblyName, Version=$DLLVersion, Culture=neutral, PublicKeyToken=$PublicKeyToken")
        } Catch {
            Write-Verbose "Unable to load $AssemblyName from GAC. Trying PowerShell module base folder..."
            #Can't load from GAC, now try PS module folder
            $DLLFilePath = Join-Path $DLLPath $DLL
            [Void][System.Reflection.Assembly]::LoadFrom($DLLFilePath)
        }
        $bSDKLoaded = $false
    }
    $bSDKLoaded
}
```

# OpsMgrExtended

- 29 Functions in the initial release:

## SDK Connection Functions

- Import-OpsMgrSDK
- Install-OpsMgrSDK
- Connect-OMManagementGroup

## Administrative Tasks

- Approve-OMManualAgents
- Backup-OMManagementPacks
- Add-OMManagementGroupToAgent
- Remove-OMManagementGroupFromAgent
- Get-OMManagementGroupDefaultSettings
- Set-OMManagementGroupDefaultSetting

## Basic Authoring Tasks

- Get-OMManagementPack
- New-OMManagementPack
- Remove-OMManagementPack
- Copy-OMManagementPack

## **New-OMManagementPackReference**

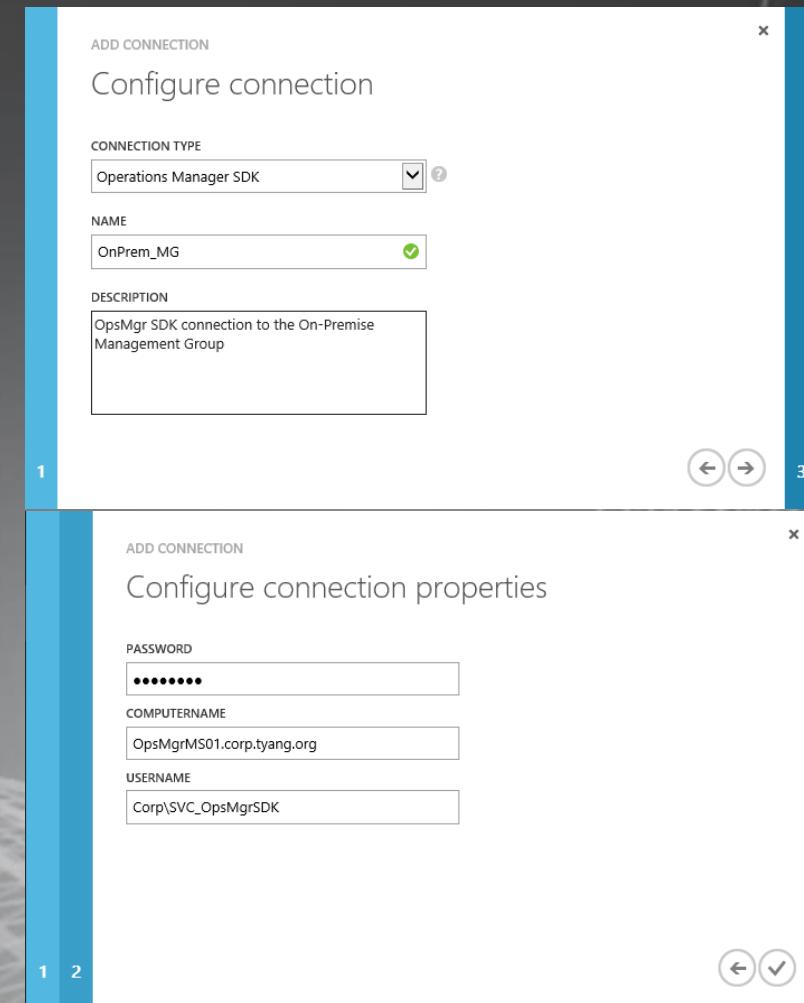

- **New-OM2StateEventMonitor**
- **New-OM2StatePerformanceMonitor**
- **New-OMPerformanceCollectionRule**
- **New-OMEVENTCollectionRule**
- **New-OMServiceMonitor**
- **New-OMInstanceGroup**
- **New-OMComputerGroup**
- **New-OMConfigurationOverride**
- **New-OMPropertyOverride**
- **New-OMOverride**
- **Remove-OMGroup**
- **Remove-OMOverride**

## Advanced Authoring Tasks

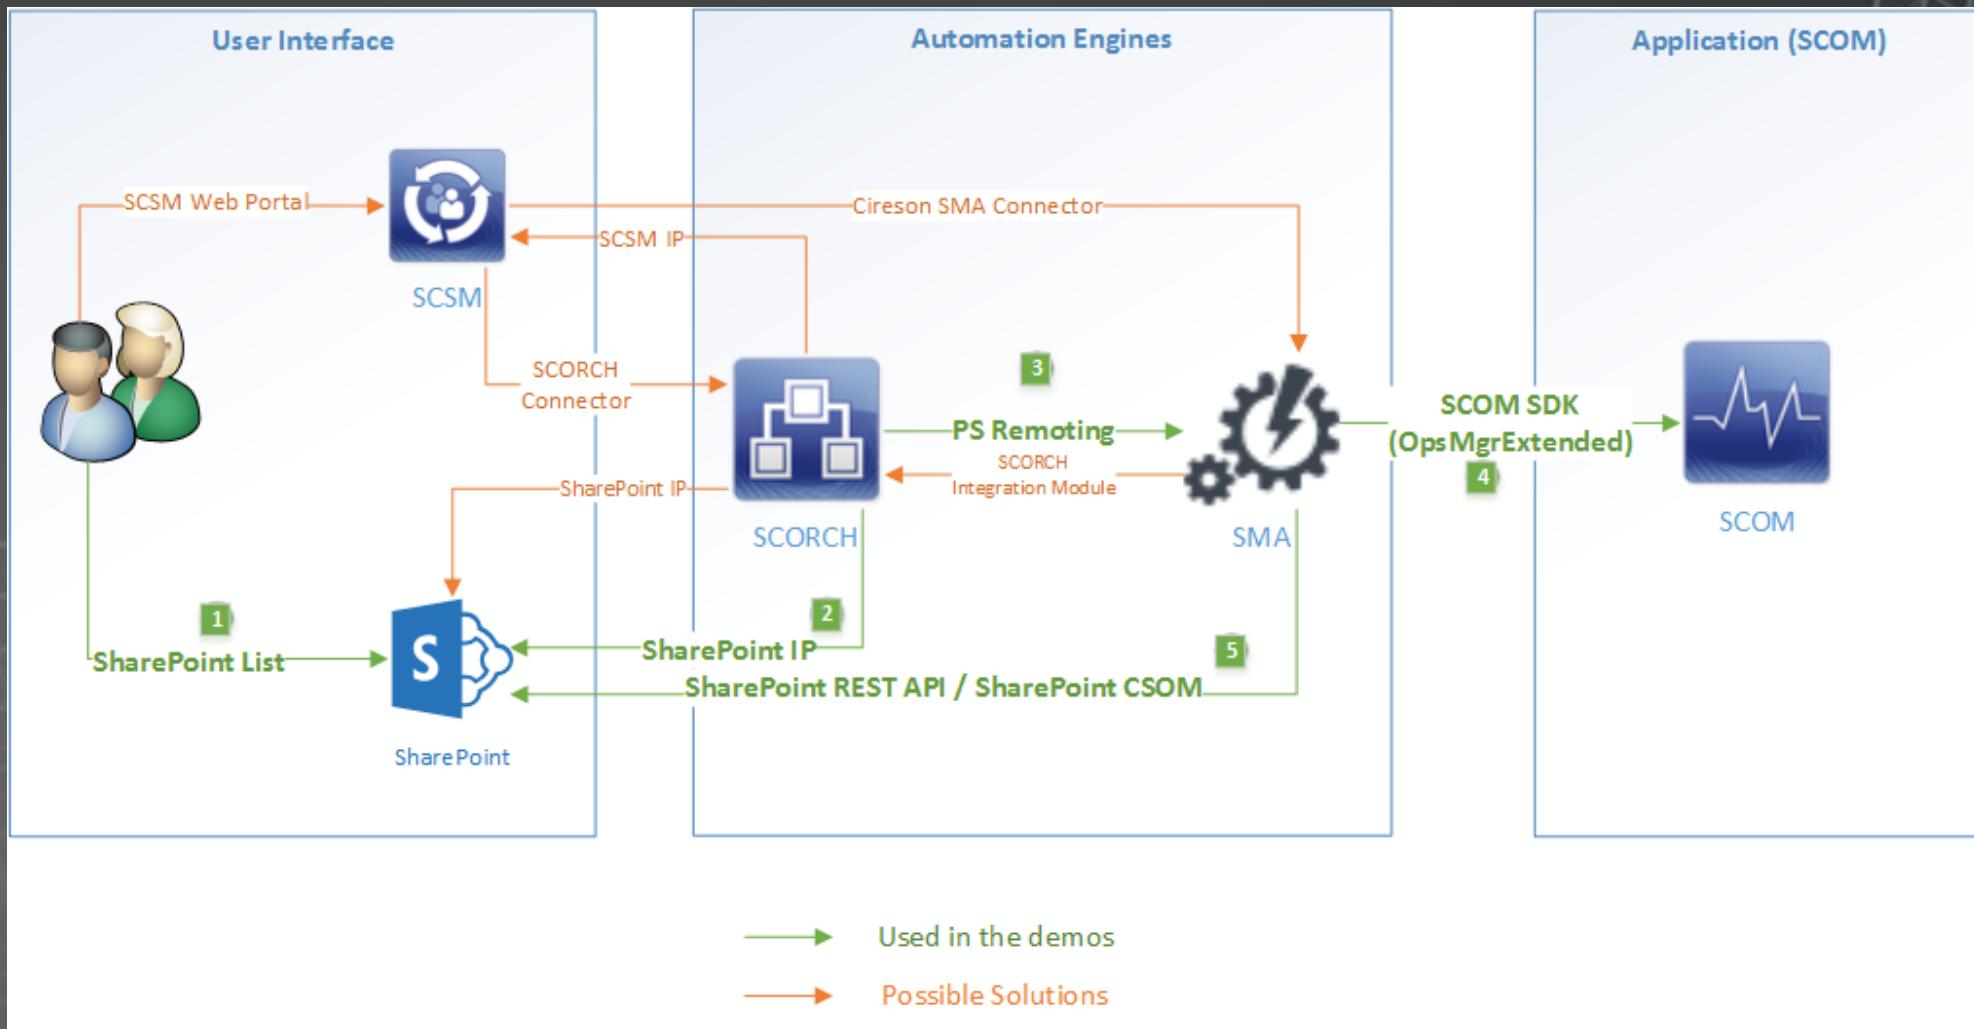

- **New-OMTCPPortCheckDataSourceModuleType**
- **New-OMTCPPortCheckMonitorType**
- **New-OMTCPPortMonitoring**

# Configure OpsMgrExtended in SMA

- Connection Type:
  - Operations Manager SDK
- ComputerName:
  - One of the SCOM management servers
- UserName:
  - A Service Account that has SCOM administrator access (i.e. Data Access Service Account)
- Password:
  - Password for the service account

# Systems Integration Options

# Demo 1: Configuring SCOM

- Copying Management Group settings between multiple MGs

## Demo 2: Basic Authoring Task

1. Create a Blank Unsealed MP (In “Test” Environment)
2. Create a 2-State Performance Monitor (In “Test” Environment)
3. Populate a MP List on SharePoint
4. Copy the newly created MP & Monitor to another MG (Move to “Production” environment).

# Demo 3

- Create TCP Port Monitoring
  - Equivalent to the TCP Port Monitor template
  - With many improvements
- What MP elements are created?
  - Class Definition for TCP Port Watcher and various groups
  - Class Relationships
  - Class and Relationship Discoveries
  - Data Source Module Type
  - Monitor Type
  - Performance Collection Rule
  - 4 Unit Monitors and a dependency monitor
  - Discovery Overrides

# Modules / Runbooks Used in the Demo

- SMA Module: **OpsMgrExtended**:
  - During final testing phase
  - To be released after been tested / reviewed by a selected group
  - Stay tuned!
- SMA Module: **SharePointSDK**:
  - <http://blog.tyang.org/2014/12/23/sma-integration-module-sharepoint-list-operations/>
- SMA Modules: **SendEmail** & **SendPushNotification**:
  - <http://blog.tyang.org/2014/10/31/simplified-way-send-emails-mobile-push-notifications-sma/>
- SMA Runbook: Update SharePoint 2013 List Item:
  - <http://blog.tyang.org/2014/08/30/sma-runbook-update-sharepoint-2013-list-item/>
